Notable exceptions: The work of McMullen, Dumas and Kent.

Bounded Image Theorem (Thurston, 1979)

If *M* is acylindrical, σ_M has compact image.

Notable exceptions: The work of McMullen, Dumas and Kent.

Bounded Image Theorem (Thurston, 1979)

If M is acylindrical, σ_M has compact image.

Theorem (McMullen, 1993):

If *M* is acylindrical, $\|d\sigma_M\| < c < 1$.

Notable exceptions: The work of McMullen, Dumas and Kent.

Bounded Image Theorem (Thurston, 1979)

If M is acylindrical, σ_M has compact image.

Theorem (McMullen, 1993):

If *M* is acylindrical, $\|d\sigma_M\| < c < 1$.

Theorem (Kent, 2009):

If M is acylindrical, $diam(\sigma_M)$ is controlled by vol(M)

Notable exceptions: The work of McMullen, Dumas and Kent.

Bounded Image Theorem (Thurston, 1979)

If M is acylindrical, σ_M has compact image.

Theorem (McMullen, 1993):

If *M* is acylindrical, $\|d\sigma_M\| < c < 1$.

Theorem (Kent, 2009):

If M is acylindrical, $diam(\sigma_M)$ is controlled by vol(M)

Theorem (Dumas, 2011):

 σ_M is open and finite-to-one.

Question:

(ロ)、(型)、(E)、(E)、 E) の(の)

Question:

How nice is σ_M? Is it always an immersion? covering map? diffeomorphism onto its image?

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Question:

How nice is σ_M? Is it always an immersion? covering map? diffeomorphism onto its image?

We present a negative answer to the questions above:

Theorem (G.):

There exists a hyperbolic structure on a genus-2 handlebody, with two rank-1 cusps, whose skinning map is non-injective and has a critical point.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

The Path of Quasi-Fuchsian Groups

▲□▶ ▲□▶ ▲国▶ ▲国▶ 三国 - のへで

Lemma

For $t \in (t_0, 1]$, Γ_t is quasi-Fuchsian, with bending lamination on bottom (resp. top) given by $\theta_t \cdot \xi$ (resp. $\vartheta_t \cdot \eta$), and convex core boundary surface on bottom (resp. top) determined by $\ell_t = \ell(\xi, \rho_t)$ (resp. $\ell(\eta, \rho_t)$).

 t_0 , θ_t , and ℓ_t are all explicit.

Lemma

For $t \in (t_0, 1]$, Γ_t is quasi-Fuchsian, with bending lamination on bottom (resp. top) given by $\theta_t \cdot \xi$ (resp. $\vartheta_t \cdot \eta$), and convex core boundary surface on bottom (resp. top) determined by $\ell_t = \ell(\xi, \rho_t)$ (resp. $\ell(\eta, \rho_t)$).

 t_0 , θ_t , and ℓ_t are all explicit.

Crucial step: Since Γ_t is preserved by the rhombic symmetry Φ , all of its geometric invariants are also. This ensures that the bending laminations are contained in the set $\{\xi, \eta\}$.

Background Again: Grafting

Problem

How do we go from the convex core boundary to the conformal boundary?

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ ―臣 … のへで

Problem

How do we go from the convex core boundary to the conformal boundary?

Solution:

Grafting provides a geometric way of passing back and forth between the convex core boundary, with its bending lamination, and the conformal boundary:

$$\mathrm{gr}:\mathcal{ML}(\Sigma)\times\mathcal{T}(\Sigma)\to\mathcal{T}(\Sigma)$$

Parameterizing the Image

Now we can build a projective model for the surface in the image, at every point along our deformation path:

 X_t is $gr(\theta_t \cdot \xi, Y_t)$, where Y_t is the $\{\xi, \eta\}$ -rhombic 4-punctured sphere determined by $\ell(\xi, \Gamma_t)$.

Non-monotonicity

Non-monotonicity

Recall:

• $Ext(\xi, \cdot)$ parameterizes the $\{\xi, \eta\}$ -rhombic set in $\mathcal{T}(\Sigma)$

(ロ)、(型)、(E)、(E)、 E) の(の)

• $Ext(\xi, \cdot)$ parameterizes the $\{\xi, \eta\}$ -rhombic set in $\mathcal{T}(\Sigma)$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

• $Ext(\xi, X_t) = 4Mod(Q_t)$

- $Ext(\xi, \cdot)$ parameterizes the $\{\xi, \eta\}$ -rhombic set in $\mathcal{T}(\Sigma)$
- $Ext(\xi, X_t) = 4Mod(Q_t)$

For non-monotonicity of σ_M , it suffices to show non-monotonicity of $Mod(Q_t)$

- $Ext(\xi, \cdot)$ parameterizes the $\{\xi, \eta\}$ -rhombic set in $\mathcal{T}(\Sigma)$
- $Ext(\xi, X_t) = 4Mod(Q_t)$

For non-monotonicity of σ_M , it suffices to show non-monotonicity of $Mod(Q_t)$

Explicit estimates on moduli of quadrilaterals are surprisingly hard, especially when the quadrilateral has an ideal vertex. Fortunately, a normalizing map will make a comparison accessible.

A Normalization for Q_t

▲□▶▲圖▶▲≣▶▲≣▶ ≣ めんの

A Normalization for Q_t

We normalize by sending a pair of sides into the vertical lines $\{\Re(z) = 0\}$ and $\{\Re(z) = 1\}$.

A Normalization for Q_t

We normalize by sending a pair of sides into the vertical lines $\{\Re(z) = 0\}$ and $\{\Re(z) = 1\}$.

Finishing Non-monotonicity

Finishing Non-monotonicity

In these coordinates, the non-monotonicity becomes visually transparent, and, more importantly, possible to show explicitly!
